BONAFIDE CERTIFICATE

This is to certify that this Summer Internship project report **"Phishing Detection Platform"** is the Bonafide work of **NAVEENKUMARAN R (810023104704)** and has satisfactorily completed the course of **CS3711 – SUMMER INTERNSHIP** for **SEVENTH** semester, **COMPUTER SCIENCE AND ENGINEERING** during the academic year **2026-2027.**

Faculty Incharge **Head of the Department**

Submitted for the practical examination held on _____.

ABSTRACT

The Phishing Detection Platform is a cyber security project developed during my internship at Fantasy Solution, Tiruchirappalli. The project focuses on building a web based platform that helps users identify phishing attacks, which use fake websites and deceptive emails to steal passwords, banking details, and other sensitive information. The platform analyses a URL or the content of an email, classifies it as Safe, Suspicious, or Phishing, calculates a risk score, and explains the reasons behind the result so that users can protect themselves.

The project follows a structured development approach consisting of Problem Definition, Data Collection, Data Preprocessing, Module Development, Integration, Testing, and Documentation. A study of phishing techniques and existing protection methods was used to understand common problems such as the inability of blacklists to detect new phishing sites, the lack of explanation for warnings, and the absence of a single tool for checking both URLs and emails. Based on the findings, a URL scanner, an email analyzer, a feature extraction module, a machine learning classification module, a blacklist and look-alike domain checker, and a risk report module were developed.

Python was the primary programming language. Lexical and domain based features were extracted from URLs, supervised machine learning models were trained to separate phishing links from legitimate ones, and Natural Language Processing techniques were used to detect urgent and threatening language and sender mismatch in emails. The application includes the Login and Registration, URL Scanner, Email Analyzer, Risk Report, Scan History, and Security Dashboard modules.

Functional, detection-module, and usability tests were carried out on the application. The results indicated that the platform gave clear and understandable verdicts, reduced the effort needed to verify suspicious links and emails, and worked consistently across modules. The internship provided practical exposure to professional cyber security project workflows and strengthened my skills in Python programming, machine learning, NLP, problem solving, testing, documentation, and presentation.

1.INTRODUCTION

An internship is an essential part of professional education because it connects academic learning with real-world industrial practice. During the internship at Fantasy Solution, Tiruchirappalli, I worked in the Cyber Security domain and developed a project named Phishing Detection Platform. Phishing is one of the most common cyber attacks, in which attackers use fake emails, messages, and websites to trick users into revealing passwords, banking details, and other sensitive information. Many users cannot easily tell a genuine link or email from a fraudulent one. The project focused on using machine learning and rule-based analysis to examine URLs and emails and to warn the user before any damage occurs. The work was carried out in Python and followed a structured project development methodology.

The project included requirement analysis, a study of existing anti-phishing techniques, dataset preparation, data preprocessing, URL feature extraction, machine learning based classification, email content analysis using NLP, blacklist and look-alike checks, risk scoring, report generation, integration, and testing.

1.1 OBJECTIVES OF THE INTERNSHIP

- To understand the professional workflow followed in cyber security and software projects.
- To learn the fundamentals of cyber security, social engineering, and phishing attacks.
- To perform requirement analysis and study existing phishing detection techniques.
- To collect and pre-process datasets of phishing and legitimate URLs and emails.
- To develop modules for URL analysis, email analysis, and machine learning based detection.
- To build a web based platform that reports a clear risk score and verdict to the user.
- To improve problem-solving, teamwork, communication, and documentation skills.

1.2 SCOPE OF THE PROJECT

The scope of the Phishing Detection Platform includes building a web based tool that helps users check whether a URL or an email is safe. The application enables users to register or log in, submit a URL or the content of a suspicious email, receive an automatic analysis with a risk score and a verdict (Safe, Suspicious, or Phishing), view the reasons behind the verdict, read safety tips, and track their previous scans on a security dashboard.

The project focuses on the detection logic and application workflow rather than on large-scale deployment or hardware. It covers the process from requirement analysis and data preparation to module development, integration, and testing. The platform is intended to be simple for users and easy to extend with new features, rules, and datasets.

1.3 PROJECT OBJECTIVES

- Analyse URLs and emails automatically for phishing indicators.
- Classify a link or email as Safe, Suspicious, or Phishing using machine learning.
- Check suspicious domains against blacklists and look-alike brand patterns.
- Explain the result clearly so that users learn why a link is risky.
- Generate a risk score, alert, and report for every scan.
- Present scan history and statistics in a simple and measurable way.
- Build a modular system that can be extended and maintained easily.

1.4 BENEFITS OF THE INTERNSHIP

- Practical exposure to industry-oriented cyber security project development.
- Hands-on experience with Python, machine learning, and web application development.
- Better understanding of phishing techniques, data preparation, and model evaluation.
- Experience in documenting a complete project and project report.
- Improved communication, presentation, teamwork, and problem-solving skills.

1.5 DEVELOPMENT APPROACH

The Phishing Detection Platform project follows a structured approach in which every module is connected to a need identified during requirement analysis. The process begins with understanding the problem and the available data, continues through data preparation and module development, and then moves into integration, testing, and documentation.

Stage	Purpose
Problem Definition	Understand how phishing attacks work and define the detection problem clearly.
Data Collection	Collect phishing and legitimate URL and email samples required by the modules.
Data Preprocessing	Clean, label, and structure the data and extract features for machine learning.
Module Development	Develop the URL, email, classification, and risk scoring modules.
Integration	Connect all modules into one web application with a simple interface.
Testing	Evaluate functionality, detection quality, and usability.
Documentation	Prepare the project report and present the results.

1.6 INTERNSHIP OUTCOME

The internship strengthened my practical understanding of cyber security and gave me experience in converting a real-world security problem into a working detection system. The Phishing Detection Platform project improved my confidence in Python programming and in applying machine learning and NLP techniques to security data, and in presenting the work through documentation, testing, and results.

1.7 TECHNOLOGIES AND TOOLS

Technology / Tool	Purpose
Python	Core programming language for all modules and detection logic.
Flask web framework	Backend routing and web interface through which users use the application.
pandas and scikit-learn	Data handling, model training, and classification of URLs.
NLP techniques (regular expressions, tokenisation)	Text cleaning and keyword analysis of email content.
HTML, CSS, and JavaScript	Front-end pages for scanning, results, and dashboard.
SQLite database	Storage of user accounts, scan history, and blacklist data.

Python was the primary development language. Its rich ecosystem of libraries supported data processing, machine learning, text analysis, and rapid prototyping of each module.

2.COMPANY PROFILE

2.1 ABOUT THE COMPANY

Fantasy Solution is an IT solution and service provider located at No. 16, Sampath Plazza, Third Floor, Madurai Main Road, Melapudur, Tiruchirappalli, Tamil Nadu – 620 001. The company provides innovative information technology enabled solutions and services such as real-time projects, web designing, web hosting, software development, and training. It follows industry-standard practices and encourages interns to work on real-time projects under the guidance of experienced trainers.

2.2 VISION

To be a leading IT company for consulting services and deployment of best of breed business solutions to top tier domestic and international customers.

2.3 MISSION

- To provide high quality software development services, professional consulting, and development outsourcing that improve customers' operations.
- To make access to information easier and securer.
- To improve communication and data exchange between businesses.
- To provide customers with value for money.
- To provide employees with meaningful work and advancement opportunities.

2.4 SERVICES OFFERED

Fantasy Solution provides the following services:

- Software Development in .NET, PHP, and Java
- Web Designing and Development
- Mobile Application Development on the Android platform
- Data Mining and Big Data Development using R and Python
- MATLAB for Image Processing and Network Simulator (NS2)
- IT Education, Project Training, and Internships
- Software Testing, Maintenance, and Support

2.5 ORGANIZATION STRUCTURE

The organization follows a structured hierarchy to ensure smooth project execution and effective teamwork.

- Managing Director
- Project Manager
- Team Lead
- Software Developers
- Project Trainers
- Quality Assurance (QA) Engineers
- Interns

The internship was carried out under the guidance of Sona S (MCA, Project Trainer, Industrial Expert and Joint Supervisor) and other experienced professionals, which helped in understanding industry practices, teamwork, project planning, and professional communication.

3.DAILY WORK REPORT

The internship lasted for 26 working days from 1 June 2026 to 30 June 2026, during which I learned cyber security fundamentals, phishing analysis, data preparation, machine learning, web application development, testing, and professional project documentation. The day-wise activities performed during the internship are presented below.

Day 1: Company orientation and introduction to the internship project, Phishing Detection Platform.

Day 2: Studied the project requirements and the fundamentals of cyber security, including the CIA triad and common cyber threats.

Day 3: Studied social engineering and the types of phishing attacks such as email phishing, spear phishing, smishing, and fake websites.

Day 4: Studied existing phishing detection methods such as blacklists, heuristics, and machine learning and identified their limitations.

Day 5: Collected requirements from fellow students and the mentor about identifying suspicious links and emails.

Day 6: Prepared the system architecture and the module-wise workflow of the application.

Day 7: Set up the Python development environment and installed the required libraries.

Day 8: Collected labelled phishing and legitimate URL datasets and sample email text.

Day 9: Cleaned and pre-processed the data by removing duplicates, handling missing values, and labelling the records.

Day 10: Developed the user registration and login module with hashed password storage.

Day 11: Studied URL structure and identified phishing indicators such as long URLs, '@' symbol, IP addresses, and many subdomains.

Day 12: Implemented the URL feature extraction module.

Day 13: Implemented HTTPS status, subdomain, and domain-based checks.

Day 14: Trained the Logistic Regression, Decision Tree, and Random Forest models on the prepared dataset.

Day 15: Evaluated the models using accuracy, precision, recall, and confusion matrix and selected the best model.

Day 16: Developed the URL scanner module and integrated the trained model.

Day 17: Developed the email analyzer to extract the sender, subject, body, and links from email content.

Day 18: Implemented NLP based detection of urgent and threatening phrases and sender and link domain mismatch.

Day 19: Developed the blacklist and brand look-alike domain checking module.

Day 20: Developed the risk score calculation and the Safe, Suspicious, and Phishing classification.

Day 21: Developed the alert, report, and safety tips generation module.

Day 22: Developed the scan history and security dashboard.

Day 23: Designed the user interface and connected all modules into a single web application.

Day 24: Performed functional testing of all modules.

Day 25: Tested the detection modules with different phishing and legitimate URLs and emails, fixed false results, and conducted usability testing.

Day 26: Prepared the project documentation, presented the project, and received feedback from the internship mentor.

4.BLOCK DIAGRAM

The following block diagram represents the working flow of the Phishing Detection Platform, that is, the steps followed by the system while analysing a URL or an email. It helps in understanding how the modules are connected.

USER LOGIN / REGISTRATION

SCAN HISTORY AND SECURITY DASHBOARD

Benefits of System Flow

- Improves understanding of the system.
- Shows how each module depends on the previous one.
- Makes testing of each stage easier.
- Helps developers extend the application.

5.PHISHING DETECTION PLATFORM

5.1 EXISTING SYSTEM

For most users and organisations, protection against phishing depends mainly on browser warnings, email spam filters, and user awareness. Blacklist-based tools cannot detect newly created phishing sites, and users rarely understand why a link was blocked or flagged.

- Blacklists detect only phishing sites that are already reported.
- New (zero-day) phishing websites are often missed.
- Spam filters give little explanation about their decisions.
- Users find it hard to identify look-alike domains and fake login pages.
- Separate tools are needed for checking URLs and emails.
- Users have no record of previous checks or statistics.

5.2 PROPOSED SYSTEM

The Phishing Detection Platform aims to provide a single intelligent web platform that analyses URLs and emails and reports their risk clearly by dividing the detection process into well defined stages.

- User registration, login, and secure session handling.
- URL scanning with automatic feature extraction.
- Machine learning based classification of phishing and legitimate URLs.
- Email content analysis for urgent language, suspicious links, and sender mismatch.
- Blacklist and brand look-alike checks for additional confidence.
- Risk score with a Safe, Suspicious, or Phishing verdict and clear reasons.
- Scan history and dashboard for tracking results.

5.3 PROPOSED SYSTEM – DESIGN CHARACTERISTICS

Area	Approach
Input	URL text or pasted email content with simple validation.
URL Analysis	Extraction of lexical and domain features such as length, special characters, and IP usage.
Email Analysis	NLP-based keyword and link analysis with sender and link mismatch checks.
Classification	Machine learning model trained on phishing and legitimate samples.
Verification	Blacklist and brand look-alike checks to support the model result.
Output	Risk score, verdict, reasons, and safety tips for every scan.

5.4 CAPABILITIES

- User registration, login, and session management.
- URL scanning and automatic feature extraction.
- Machine learning based phishing classification.
- Email content analysis using NLP.
- Blacklist and look-alike domain checking.
- Risk score calculation with Safe, Suspicious, and Phishing verdicts.
- Alert, report, and safety tips for every scan.
- Scan history and security dashboard.

6.PROPOSED METHOD

6.1 REQUIREMENT ANALYSIS

Requirement analysis is the process of understanding user needs, system expectations, and problems before building an application. It ensures that the modules solve real problems of users. For the Phishing Detection Platform, requirements were gathered to understand how users come across phishing links and what difficulties they face in identifying them.

Analysis Methods

- Discussion with the mentor and fellow students
- Study of existing anti-phishing tools and techniques
- Review of common phishing indicators in URLs and emails
- Observation of typical phishing emails and fake websites

Key Requirements

- Users want a quick way to check whether a link or email is safe.
- Users want to understand why a link is flagged.
- The system should detect new phishing links, not only known ones.
- The system should support both URL and email inputs.
- The system should be simple, fast, and easy to use.
- The detection results should be clear, consistent, and responsible.

6.2 DATA COLLECTION AND PREPROCESSING

Data is the foundation of every machine learning module. The system needs labelled examples of phishing and legitimate URLs, a list of known malicious domains, and text samples of phishing emails for analysis.

Data Used

- Labelled phishing and legitimate URL datasets
- List of known phishing domains for blacklist checking
- List of popular brand names for look-alike detection
- Phishing and genuine email text samples
- Sample URLs and emails for testing

Preprocessing Steps

- Removal of duplicate and invalid URLs
- Handling of missing values and consistent labelling (phishing = 1, legitimate = 0)
- Extraction of numeric features from every URL
- Conversion of email text to lowercase and removal of noise and special characters
- Splitting the data into training and testing sets

6.3 MACHINE LEARNING AND NLP TECHNIQUES

The detection modules use a combination of feature-based machine learning, natural language processing, and rule-based checks. Each technique is used where it gives the clearest and most reliable result.

Techniques Used

- Lexical feature extraction from URLs (length, dots, hyphens, '@' symbol, IP address)
- Domain-based checks such as HTTPS status, number of subdomains, and domain age
- Supervised models such as Logistic Regression, Decision Tree, and Random Forest
- Keyword and pattern analysis of email text using NLP
- Weighted risk scoring that combines model output and rule results

Advantages

- Detects new phishing links that are not yet in any blacklist.
- Explainable results based on visible features.
- Works for both URLs and email content.
- Easy to update with new rules, features, and data.

6.4 SYSTEM ARCHITECTURE

The system is organised into layers so that each part can be developed, tested, and improved independently. The architecture of the Phishing Detection Platform includes:

Architecture Layers

- User Interface Layer – login page, scan forms, result pages, and dashboard
- Application Layer – session handling, input validation, and module control
- Detection Layer – feature extraction, classification, email analysis, and risk scoring
- Data Layer – user accounts, blacklist, trained model, and scan history

Main Modules

- Login and Registration
- URL Scanner
- Email Analyzer
- Feature Extraction and Classification
- Threat Check (Blacklist and Look-alike)
- Risk Report and Alerts
- Security Dashboard

Benefits

- Maintains modularity.
- Simplifies testing and debugging.
- Allows new detection rules to be added easily.
- Supports future deployment.

6.5 DETECTION ENGINE DESIGN

The detection engine is the core of the platform. It combines the machine learning result with rule-based checks to produce the final verdict. Its behaviour is designed so that the results stay accurate, understandable, and consistent.

Design Principles

- Every scan is converted into a fixed set of measurable features.
- The model output is combined with blacklist and look-alike checks.
- Results are shown with clear reasons and a risk score.
- Borderline results are marked Suspicious instead of Safe.
- The platform gives guidance and does not claim to be 100% accurate.

Advantages

- Fast results for every scan.
- Reduces dependence on manual checking.
- Consistent and explainable decisions.

6.6 INTEGRATION AND PROTOTYPE

After the individual modules were tested, they were integrated into a single working web application with a simple interface so that a user can move from login to scanning, reporting, and history without leaving the system.

Prototype Features

- Login, registration, and secure session
- URL and email scanning
- Risk score and verdict with reasons
- Blacklist and look-alike check results
- Scan history and security dashboard

Advantages

- Helps evaluate the complete user journey.
- Identifies issues between modules early.
- Provides a realistic preview of the final system.
- Supports future development and deployment.

7.ALGORITHM

7.1 USER LOGIN AND REGISTRATION

- User opens the application and the login page is shown.
- User enters the login details, or registers as a new user.
- The system validates the entered details.
- On successful login, the scanner home page is opened.
- The user chooses to scan a URL or to analyse an email.
- The user session is maintained for saving the scan history.

7.2 URL ANALYSIS

- User enters the URL to be checked.
- The system validates and normalises the URL.
- Lexical and domain features are extracted from the URL.
- The trained model predicts whether the URL is phishing or legitimate.
- The prediction probability is passed to the risk scoring step.

7.3 EMAIL ANALYSIS

- User pastes the sender, subject, and body of the email.
- The text is cleaned and tokenised.
- Links, urgency words, and threat phrases are identified using NLP.
- The sender domain is compared with the domains of the links.
- Every link in the email is checked using the URL analysis algorithm.

7.4 BLACKLIST CHECK AND RISK SCORING

- The domain is compared with the list of known phishing domains.
- Brand names are checked for look-alike spellings (for example, a digit replacing a letter).
- The model probability and rule results are weighted and combined.
- The score is mapped to a Safe, Suspicious, or Phishing verdict.

7.5 ALERT AND REPORT GENERATION

- The verdict, risk score, and detected indicators are collected.
- An alert is shown for Suspicious and Phishing results.
- Safety tips are displayed according to the type of threat.
- The scan result is saved in the history.

7.6 DASHBOARD AND HISTORY

- Previous scan results are read from the database.
- Counts of safe, suspicious, and phishing scans are calculated.
- Statistics and recent scans are displayed on the dashboard.
- The dashboard is updated after every new scan.

7.7 GENERAL ALGORITHM

Input → Validation → Preprocessing → Feature Extraction → Classification → Blacklist and Look-alike Check → Risk Scoring → Alert and Report → History Update → Final Output

8.IMPLEMENTATION

8.1 LOGIN AND REGISTRATION MODULE

This module allows users to create an account and log in securely. It validates the entered details, stores passwords in hashed form, manages the session, and opens the scanner after a successful login.

8.2 URL SCANNER MODULE

The URL Scanner accepts a URL, validates it, and extracts the features required by the model. The extracted features are passed to the classifier, which predicts whether the link is phishing or legitimate.

8.3 EMAIL ANALYZER MODULE

The Email Analyzer accepts the sender, subject, and body of an email. It uses NLP to find urgent language, threatening phrases, and links, and compares the sender domain with the link domains to detect spoofing.

8.4 FEATURE EXTRACTION MODULE

This module converts every URL into a set of measurable features such as URL length, number of dots and hyphens, presence of the '@' symbol or an IP address, number of subdomains, and HTTPS status.

8.5 CLASSIFICATION MODULE

The classification module uses a trained machine learning model to predict the probability that a URL is phishing. The model was trained on labelled phishing and legitimate URLs and compared with other models before it was selected.

8.6 THREAT CHECK MODULE

This module compares the domain with a list of known phishing domains and checks whether it imitates a popular brand name. Its result is used to support or correct the model prediction.

8.7 RISK REPORT AND ALERT MODULE

This module combines the model probability and the rule results into a risk score from 0 to 100, assigns a Safe, Suspicious, or Phishing verdict, and displays the reasons and safety tips.

8.8 SECURITY DASHBOARD

The dashboard combines the scan history into counts of safe, suspicious, and phishing results, and shows the recent scans and statistics for the user.

9.SAMPLE OUTPUT

The following sample outputs are taken from the Phishing Detection Platform and demonstrate the working modules of the application developed during the internship.

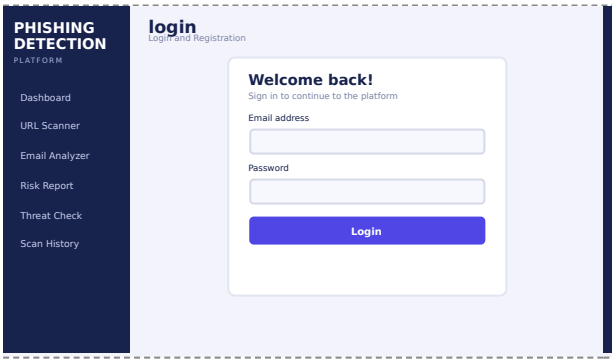

Figure 9.1 – Login and Registration Page

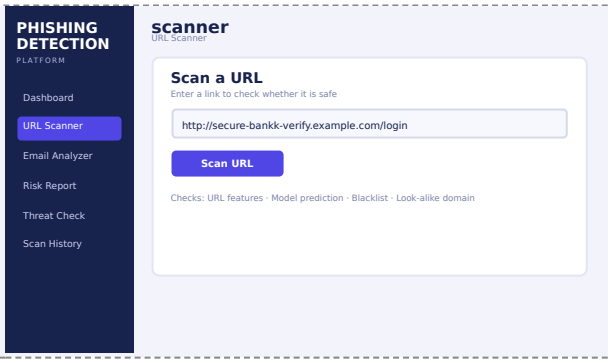

Figure 9.2 – URL Scanner Page

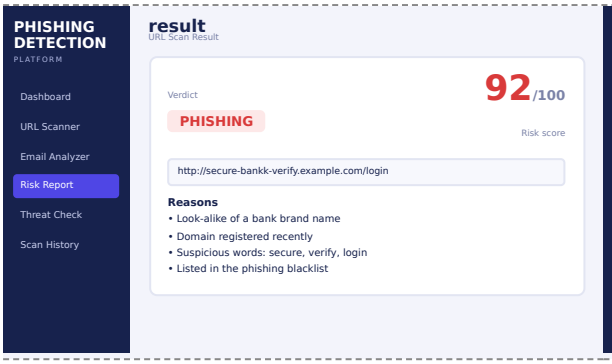

Figure 9.3 – URL Scan Result

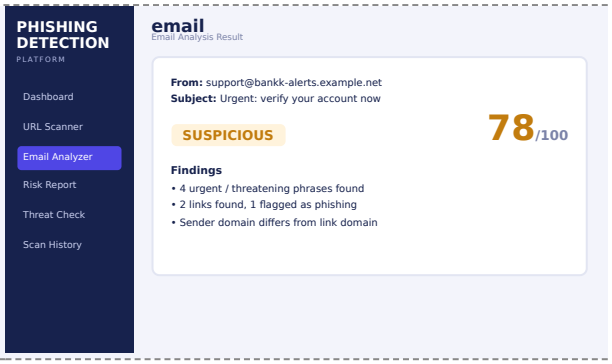

Figure 9.4 – Email Analysis Result

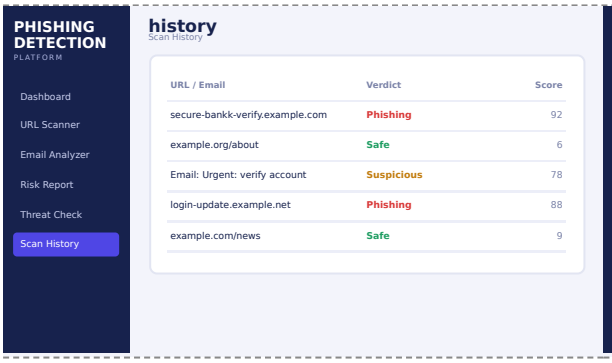

Figure 9.7 – Scan History

Figure 9.8 – Security Dashboard

10.ANALYSIS

10.1 TESTING OVERVIEW

Testing is an important phase in the development process used to verify the quality, accuracy, and usability of the application. The Phishing Detection Platform was tested to ensure that every module works correctly, that the detection results are reliable, and that the application is easy to use.

10.2 FUNCTIONAL TESTING

Functional testing was performed to verify whether all modules work according to the requirements.

Tested Features

- Registration, login, and session handling
- URL input validation and scanning
- Feature extraction from URLs
- Machine learning classification
- Email analysis and link extraction
- Blacklist and look-alike checking
- Risk score and report generation
- Scan history and dashboard

10.3 DETECTION MODULE TESTING

Detection module testing was conducted to check the quality and reliability of the outputs produced by the classification, email analysis, and risk scoring modules using different phishing and legitimate samples.

Detection Testing Includes

- Correct classification of known phishing and legitimate URLs
- Detection of look-alike and IP-based URLs
- Identification of urgent and threatening language in emails
- Consistency of risk scores for repeated scans
- Handling of empty, invalid, or very long inputs

10.4 USABILITY TESTING

Usability testing was performed to evaluate the ease of use of the application.

Testing Objectives

- Check navigation between modules.
- Identify difficult or confusing steps.
- Improve the readability of results and reasons.
- Ensure a simple and effective interface.

10.5 TEST RESULTS

Test Area	Result
Login, Registration and Session	Passed
URL Scanner	Passed
Email Analyzer	Passed
Classification Module	Passed
Blacklist and Look-alike Check	Passed
Risk Report and Alerts	Passed
Security Dashboard	Passed
Usability	Passed

11.CONCLUSION

11.1 LEARNING OUTCOMES

The internship at Fantasy Solution, Tiruchirappalli provided practical experience in cyber security and real-time project development.

Skills Gained

- Python programming for security applications
- Understanding of phishing, social engineering, and cyber security fundamentals
- Machine learning classification and model evaluation
- Natural language processing of email text
- Web application development and testing
- Professional communication and team collaboration

11.2 CONCLUSION

The internship provided valuable industrial exposure and helped me understand the complete life cycle of a cyber security project. The Phishing Detection Platform was successfully developed by applying machine learning, NLP, and rule-based techniques to detect phishing URLs and emails.

Through this internship, I gained practical knowledge in building secure, modular, and user-friendly applications. The experience improved my technical skills, problem-solving ability, and confidence in handling real-world security problems, and strengthened my interest in the field of cyber security.

The Phishing Detection Platform brings URL scanning, email analysis, blacklist checking, and risk reporting into one platform. By applying structured data preparation, modular development, and repeated testing, the project delivered a system that gives users clear and explainable results. The application can now serve as a base for further development and wider use.

Key Outcomes of the Project

- Working modules covering the user journey from login to scan history.
- A machine learning based URL classifier with feature extraction.
- An NLP-based email analyzer that finds suspicious links and language.
- A risk score, alert, and safety tips for every scan.
- Complete project documentation prepared for future development.

12.FUTURE WORK

The future enhancements of the Phishing Detection Platform include:

- A browser extension for real-time protection while browsing.
- Detection of phishing through SMS and messaging applications.
- Integration with live threat intelligence feeds and URL reputation services.
- Automatic analysis of email headers and attachments.
- Deep learning models trained on larger and more diverse datasets.
- Page content and visual similarity analysis to detect fake login pages.
- Multi-language support, including Tamil.
- An administrator dashboard for organisations and a mobile application version.

These enhancements will extend the Phishing Detection Platform from an internship project into a complete, data-driven anti-phishing solution for users and organisations.

Dear Naveenkumaran,

Sub: Internship

On behalf of **FANTASY SOLUTION**. We would like to inform you that you have been accepted as one of our interns. We are pleased to inform you that you have been accepted as per the company requirements for the internship with **CYBER SECURITY**.

Your internship wil l begin from **01st June 2026 to 30th June 2026**. You would assign to various tasks which relates to the project assigned to you after whom your performance would be assessed and appraised.
